Customer Reviews

Robert D. Griffin, M.A., has been teaching biology for 27 years. For the last 19 years he has been on the faculty of City College of San Francisco, where he has taught biology courses ranging from anatomy to zoology. Previously he had extensive experience teaching in junior and senior high schools and in special science programs for gifted elementary school students. His principal academic interest is in innovative methods of teaching biological concepts and reasoning to both liberal arts students and biology majors.

I teach high school biology and physical science . My students in general are probably on anywhere between a 4th-to on grade level learning. All of my students do much better with hands on activities so I thought coloring would be great. The book is defiantly for older students however-it helps raise the bar for my students in a less threatening way. With that said let me describe the book:On one page you get a lesson-as you read it it tell you to stop and color a part of the picture and then you continue to read-and then stop and color. That's awesome. Very paced and structured . In addition it's not just biology-it has covers everything from matter to covalent bonds -but covers way more biology. All in all a great buy.

I had to take a Biology Placement (Accuplacer) Test in order to skip classes when I went back to school after a very long hiatus. (A lot of the science classes only have a 5-7 year life span in the academic world.) I had graduated in Zoology back in the day, so I have taken many biology courses. That being said, this book not only provided a very good review, but it also taught me a lot of things in depth that I was only somewhat familiar with. It was a time consuming review of biology, but being a very visual learner, everything stuck much better than it would have just doing practice tests. Oh, and I was able to pass my placement test with flying colors (one that was very much like the final exam of a basic college biology class).

I'm a college student who purchased this book for a class. I recognize that it is not intended for my age group, however, I found the writing to be somewhat confusing even knowing the material already being discussed. The pictures were very detailed to the point I didn't even want to begin coloring as there was so much to do--I'm not an artist nor do I color for fun. In that regard some might enjoy it much more than I. Overall it was good and did cover the main topics that were covered in my General Biology 1 course that I had taken.

If you have trouble with biology this will help. I'm in college and got this and it totally helped me pass my biology class. Would really be great for high school students too! Someday if I have kids, they will use this as well. Really worth it.

I love this book. I bought it to keep my mind fresh of biology. Since I graduated this summer and I miss school a whole lot. I am a science major as you can see. While I enter med school, I am entertaining myself coloring cells and atoms. This book is great I recommend it to everyone. It also has explanations of each thing you are coloring. This is a great gift for even little kids who are enthusiasts of science. Grown ups too. ;)

There are some usable great coloring pages that depict some aspects of biology, but it is very complex for the most part

Great visuals. Bought for my Grand daughter.

Good book for my biology students.
